

# HALOFOG 300 PC

## THE WORLD DESERVES QUALITY POTATOES.

NEWEST  
INNOVATION

### Care for your potatoes at their destination

Potatoes are transported in refrigerated controlled containers on a large scale, sometimes for transport phases of more than 3-5 weeks. Unloading high-quality, sprout-free potatoes after a weeks-long journey is often a challenge. Dormancy enhancers such as 1,4SIGHT® help to maintain quality and prevent sprouting. The challenge in export is the safe and effective application of the product.

**Veugen Technology has worked closely with DORMFRESH to develop the Halofog® 300 PC: a unique device that seals the container while 1,4SIGHT® is being applied, to give a long lasting effect in sprout dormancy.** The device is easy to use: simply slide it in front of the half-opened container opening and start and control the application from the outside. The application can be carried out in a very short time in a dry fog quality.

**Halofog® 300 PC** was developed in close collaboration with DORMFRESH, a company that has been committed to sprout-free potatoes for more than two decades. 1,4SIGHT® is the brand name of their sprout inhibitor, which has been proving its worth and adding value in Europe for several years.

**Halofog® 300 PC** and 1,4SIGHT® is a very effective combination for the safe transport of potatoes to distant destinations.

If you are interested in this solution, we will be happy to provide you with information and details about the new device and the well-proven product.
