

ULTRAFOGGER

THE FOGGING MACHINE WITH THE DRIEST FOG

The driest fog for the best results

The Ultrafogger is designed for disinfecting rooms and objects in rooms. The guaranteed droplet size of less than 10 micron ensures that all objects and the room itself receive equal treatment, while staying completely dry. Any impairment is avoided because only tiny amounts of agent come into contact with the object surface. The Ultrafogger series consists of two basic models. The first model is stationary and functional, without many extras. The other model is mobile and has a sleek stainless steel housing, for locations and situations in which the machine comes in contact with clients or customers. The Ultrafogger is frequently used for disinfection. It is then combined with Hydrogen peroxide and can be used for disinfection on a daily basis. The Ultrafogger may also be used for humidification or professional decorative means.
